## scipy.signal.periodogram

`scipy.signal.periodogram(x, fs=1.0, window='boxcar', nfft=None, detrend='constant', return_onesided=True, scaling='density', axis=-1)` [\[source\]](#)  
(<https://github.com/scipy/scipy/blob/v1.6.0/scipy/signal/spectral.py#L158-L288>)

Estimate power spectral density using a periodogram.

**Parameters:** `x` : *array\_like*

Time series of measurement values

`fs` : *float, optional*

Sampling frequency of the `x` time series. Defaults to 1.0.

`window` : *str or tuple or array\_like, optional*

Desired window to use. If `window` is a string or tuple, it is passed to `get_window` ([scipy.signal.get\\_window.html#scipy.signal.get\\_window](https://scipy.signal.get_window.html#scipy.signal.get_window)) to generate the window values, which are DFT-even by default. See `get_window` ([scipy.signal.get\\_window.html#scipy.signal.get\\_window](https://scipy.signal.get_window.html#scipy.signal.get_window)) for a list of windows and required parameters. If `window` is *array\_like* it will be used directly as the window and its length must be `nperseg`. Defaults to 'boxcar'.

`nfft` : *int, optional*

Length of the FFT used. If `None` the length of `x` will be used.

`detrend` : *str or function or False, optional*

Specifies how to detrend each segment. If `detrend` ([scipy.signal.detrend.html#scipy.signal.detrend](https://scipy.signal.detrend.html#scipy.signal.detrend)) is a string, it is passed as the `type` argument to the `detrend` ([scipy.signal.detrend.html#scipy.signal.detrend](https://scipy.signal.detrend.html#scipy.signal.detrend)) function. If it is a function, it takes a segment and returns a detrended segment. If `detrend` ([scipy.signal.detrend.html#scipy.signal.detrend](https://scipy.signal.detrend.html#scipy.signal.detrend)) is `False`, no detrending is done. Defaults to 'constant'.

`return_onesided` : *bool, optional*

If `True`, return a one-sided spectrum for real data. If `False` return a two-sided spectrum. Defaults to `True`, but for complex data, a two-sided spectrum is always returned.

`scaling` : *{ 'density', 'spectrum' }, optional*

Selects between computing the power spectral density ('density') where `Pxx` has units of  $V^2/Hz$  and computing the power spectrum ('spectrum') where `Pxx` has units of  $V^2$ , if `x` is measured in `V` and `fs` is

measured in Hz. Defaults to 'density'

**axis** : *int, optional*

Axis along which the periodogram is computed; the default is over the last axis (i.e. `axis=-1`).

**Returns:**     **f** : *ndarray*

Array of sample frequencies.

**Pxx** : *ndarray*

Power spectral density or power spectrum of *x*.

**See also:**

**welch** ([scipy.signal.welch.html#scipy.signal.welch](#)) Estimate power spectral density using Welch's method

**lombscargle** ([scipy.signal.lombscargle.html#scipy.signal.lombscargle](#)) Lomb-Scargle periodogram for unevenly sampled data

## Notes

---

*New in version 0.12.0.*

## Examples

---

```
>>> from scipy import signal
>>> import matplotlib.pyplot as plt
>>> np.random.seed(1234)
```

Generate a test signal, a 2 Vrms sine wave at 1234 Hz, corrupted by 0.001 V<sup>2</sup>/Hz of white noise sampled at 10 kHz.

```
>>> fs = 10e3
>>> N = 1e5
>>> amp = 2*np.sqrt(2)
>>> freq = 1234.0
>>> noise_power = 0.001 * fs / 2
>>> time = np.arange(N) / fs
>>> x = amp*np.sin(2*np.pi*freq*time)
>>> x += np.random.normal(scale=np.sqrt(noise_power), size=time.shape)
```

Compute and plot the power spectral density.

```
>>> f, Pxx_den = signal.periodogram(x, fs)
>>> plt.semilogy(f, Pxx_den)
>>> plt.ylim([1e-7, 1e2])
>>> plt.xlabel('frequency [Hz]')
>>> plt.ylabel('PSD [V**2/Hz]')
>>> plt.show()
```

If we average the last half of the spectral density, to exclude the peak, we can recover the noise power on the signal.

```
>>> np.mean(Pxx_den[25000:])
0.00099728892368242854
```

Now compute and plot the power spectrum.

```
>>> f, Pxx_spec = signal.periodogram(x, fs, 'flatop', scaling='spectrum')
>>> plt.figure()
>>> plt.semilogy(f, np.sqrt(Pxx_spec))
>>> plt.ylim([1e-4, 1e1])
>>> plt.xlabel('frequency [Hz]')
>>> plt.ylabel('Linear spectrum [V RMS]')
>>> plt.show()
```

The peak height in the power spectrum is an estimate of the RMS amplitude.

```
>>> np.sqrt(Pxx_spec.max())
2.0077340678640727
```
